1. Introduction

Fibronectin (FN) also known as LETS, is identified on the surfFN of fibroblasts by labeling with radioactive compounds or specific antibodies. Fibronectin is a 430,000-dalton dimeric glycoprotein that exists in 2 forms, termed cellular and plasma fibronectin. Cellular and plasma fibronectins are heterodimers consisting of similar but not identical polypeptides.\(^1\) These two forms of FN differ in biologic activity. Fibronectins bind cell surfFNs and various compounds including collagen, fibrin, heparin, DNA, and actin. Because fibronectin stimulates endocytosis in several systems and promotes the clearance of particulate material from the circulation, it could function in the clearance of C1q-coated material such as immune complexes or cellular debris.\(^2\) Fibronectins are involved in cell adhesion, cell motility, opsonization, wound healing, and maintenance of cell shape. LETS, encoded on chromosome 8, is responsible for the LETS protein expression in humans. Because LETS has been implicated in tumorigenicity and cellular transformation, it is of interest that rearrangement or modifications in the number of chromosome 8 have been associated with certain forms of cancer.\(^3\) The standard used in this kit is isolated from human plasma with the molecular mass of 200-250KDa.

2. Principles of Method

AbFrontier’s human Fibronectin ELISA Kit was based on standard sandwich enzyme-linked immune-sorbent assay technology. Human Fibronectin specific-specific polyclonal antibodies were precoated onto 96-well plates. The human specific detection polyclonal antibodies were biotinylated. The test samples and biotinylated detection antibodies were added to the wells subsequently and then followed by washing with PBS or TBS buffer. Avidin-Biotin-Peroxidase Complex was added and unbound conjugates were washed away with PBS or TBS buffer. HRP substrate TMB was used to visualize HRP enzymatic reaction. TMB was catalyzed by HRP to produce a blue color product that changed into yellow after adding acidic stop solution. The density of yellow is proportional to the human Fibronectin amount of sample captured in plate.
3. Intended Use

The AbFrontier Human FIBRONECTIN ELISA kit is to be used for the in vitro quantitative determination of Human FIBRONECTIN in serum, plasma, body fluids, tissue lysates or cell culture supernates. This kit has been configured for research use only and is not to be used in diagnostic procedures.

4. Storage and Stability

All kit components of this kit are stable at 2 to 8°C. Any unused reconstituted standard should be discarded or frozen at -20°C. Standard can be frozen and thawed one time only without loss of immunoreactivity.

5. Chemical Hazard

- Stop solution: This reagent is an irritant to eyes, skin and mucous membranes. Avoid contact with eyes, skin and clothing. Wear suitable protective clothing, gloves and eye protection. In the event of contact with eyes or skin, wash immediately with plenty of water.
- All reagents containing Sodium Azide also contain Thimerosal as a preservative. Thimerosal contains Hg thus should be handled with great care.

① 96 Well Plate
   : Human FIBRONECTIN microtiter plate, one plate of 96 wells.
   A plate using break-apart strips coated with a monoclonal antibody specific to Human FIBRONECTIN.

② Standard Protein
   : Lyophilized Human FIBRONECTIN.

③ Secondary Antibody
   : Biotin labeled anti Human FIBRONECTIN antibody.

④ AV-HRP
   : Avidin-Biotin-Peroxidase Complex (ABC)

⑤ Substrate (Stabilized chromogen)
   : Tetramethylbenzidine (TMB) solution

⑥ Stop Solution
   : 1 N solution of sulfuric acid (H₂SO₄)

Notice for Application of Kit

1. Before using Kit, spin tubes and bring down all components to bottom of tube.
2. Duplicate well assay was recommended for both standard and sample testing.
3. Don’t let 96-well plate dry, dry plate will inactivate active components on plate.
4. In order to avoid marginal effect of plate incubation due to temperature difference (reaction may be stronger in the marginal wells), it is suggested that the diluted ABC and TMB solution will be pre-warmed in 37°C for 30 min before using.
7. Materials Required But Not Provided

① Microtiter plate reader in standard size.
② Automated plate washer.
③ Distilled or deionized water
④ Calibrated, adjustable precision pipettes, preferably with disposable plastic tips (A manifold multi-channel pipette is desirable for large assays.)
⑤ Data analysis and graphing software
⑥ Vortex mixer
⑦ Polypropylene tubes for diluting and aliquoting standard
⑧ Absorbent paper towels
⑨ Calibrated beakers and graduated cylinders of various sizes
⑩ Washing buffer (neutral PBS or TBS). Preparation of 0.01M TBS: Add 1.2g Tris, 8.5g NaCl; 450μl of purified acetic acid or 700μl of concentrated hydrochloric acid to 1000ml H₂O and adjust pH to 7.2-7.6. Finally, adjust the total volume to 1L.

Preparation of 0.01 M PBS: Add 8.5g sodium chloride, 1.4g Na₂HPO₄ and 0.2g NaH₂PO₄ to 1000ml distilled water and adjust pH to 7.2-7.6. Finally, adjust the total volume to 1L.

8. Reagent Preparation

1) Sample Preparation and Storage

Store samples to be assayed within 24 hours at 2-8°C. For long-term storage, aliquot and freeze samples at -20°C.

Avoid repeated freeze-thaw cycles.

- **Cell culture supernate, tissue lysate or body fluids**: Remove particulates by centrifugation, analyze immediately or aliquot and store at -20°C

- **Serum**: Allow the serum to clot in a serum separator tube (about 4 hours) at room temperature. Centrifuge at approximately 1000 X g for 15 min. Analyze the serum immediately or aliquot and store frozen at -70°C.

- **Plasma**: Collect plasma using EDTA as an anticoagulant. Centrifuge for 15 min at 1000 X g within 30 min of collection. Analyze immediately or aliquot and store frozen at -70°C.

2) Sample Dilution Guideline

The user needs to estimate the concentration of the target protein in the sample and select a proper dilution factor so that the diluted target protein concentration falls near the
middle of the linear regime in the standard curve. Dilute the sample using the provided diluent buffer. The following is a guideline for sample dilution. Several trials may be necessary in practice. **The sample must be well mixed with the diluent buffer.**

- **High target protein concentration (100-1000 ng/ml).** The working dilution is 1:100. i.e. Add 1 μl sample into 99 μl sample diluent buffer.
- **Medium target protein concentration (10-100 ng/ml).** The working dilution is 1:10. i.e. Add 10 μl sample into 90 μl sample diluent buffer.
- **Low target protein concentration (156-10000 pg/ml).** The working dilution is 1:2. i.e. Add 50 μl sample to 50 μl sample diluent buffer.
- **Very Low target protein concentration (≤156 pg/ml).** No dilution necessary, or the working dilution is 1:2.

3) **Reagent Preparation and Storage**

A. Reconstitution of the Human FIBRONECTIN standard: FIBRONECTIN standard solution should be prepared no more than 2 hours prior to the experiment. Two tubes of FIBRONECTIN standard (10ng per tube) are included in each kit. Use one tube for each experiment.

a. 10,000pg/ml of human Fibronectin standard solution: Add 1 ml sample diluent buffer into one tube, keep the tube at room temperature for 10 min and mix thoroughly.

b. 5000pg/ml → 156pg/ml of human Fibronectin standard solutions: Label 6 Eppendorf tubes with 5000pg/ml, 2500pg/ml, 1250pg/ml, 625pg/ml, 313pg/ml, 156pg/ml, respectively. Aliquot 0.3 ml of the sample diluent buffer into each tube. Add 0.3 ml of the above 10, 000pg/ml Fibronectin standard solution into 1st tube and mix. Transfer 0.3 ml from 1st tube to 2nd tube and mix. Transfer 0.3 ml from 2nd tube to 3rd tube and mix, and so on.

**Note:** The standard solutions are best used within 2 hours. The 10 ng/ml standard solution should be stored at 4°C for up to 12 hours, or at -20°C for up to 48 hours. Avoid repeated freeze-thaw cycles.

B. Preparation of biotinylated anti-Human FIBRONECTIN antibody working solution: The solution should be prepared no more than 2 hours prior to the experiment.

a. The total volume should be: 0.1ml/well x (the number of wells). (Allowing 0.1-0.2 ml more than total volume)

b. Biotinylated anti-Human FIBRONECTIN antibody should be diluted in 1:100 with the antibody diluent buffer and mixed thoroughly.

C. Preparation of Avidin-Biotin-Peroxidase Complex (ABC) working solution: The solution should be prepared no more than 1 hour prior to the experiment.
a. The total volume should be: 0.1ml/well x (the number of wells). (Allowing 0.1-0.2 ml more than total volume)

b. Avidin-Biotin-Peroxidase Complex (ABC) should be diluted in 1:100 with the ABC dilution buffer and mixed thoroughly.

9. Assay Procedure

The ABC working solution and TMB color developing agent must be kept warm at 37°C for 30 min before use. When diluting samples and reagents, they must be mixed completely and evenly. Standard FIBRONECTIN detection curve should be prepared for each experiment. The user will decide sample dilution fold by crude estimation of FIBRONECTIN amount in samples.

1. Aliquot 0.1ml per well of the 10,000pg/ml, 5000pg/ml, 2500pg/ml, 1250pg/ml, 625pg/ml, 313pg/ml, 156pg/ml human Fibronec

1 t standard solutions into the precoated 96-well plate. Add 0.1ml of the sample diluent buffer into the control well (Zero well). Add 0.1ml of each properly diluted sample of human serum, plasma, body fluids, tissue lysates or cell culture supernatants to each empty well. See “Sample Dilution Guideline” above for details. We recommend that each human Fibronectin standard solution and each sample is measured in duplicate.

2. Seal the plate with the cover and incubate at 37°C for 90 min.

3. Remove the cover, discard plate content, and blot the plate onto paper towels or other absorbent material. Do NOT let the wells completely dry at any time.

4. Add 0.1ml of biotinylated anti-Human FIBRONECTIN antibody working solution into each well and incubate the plate at 37°C for 60 min.

5. Wash plate 3 times with 0.01M TBS or 0.01M PBS, and each time let washing buffer stay in the wells for 1 min. Discard the washing buffer and blot the plate onto paper towels or other absorbent material. (Plate Washing Method: Discard the solution in the plate without touching the side walls. Blot the plate onto paper towels or other absorbent material. Soak each well with at least 0.3 ml PBS or TBS buffer for 1~2 minutes. Repeat this process two additional times for a total of THREE washes. Note: For automated washing, aspirate all wells and wash THREE times with PBS or TBS buffer, overfilling wells with PBS or TBS buffer. Blot the plate onto paper towels or other absorbent material.)

6. Add 0.1ml of prepared ABC working solution into each well and incubate the plate at 37°C for 30 min.

7. Wash plate 5 times with 0.01M TBS or 0.01M PBS, and each time let washing buffer
stay in the wells for 1-2 min. Discard the washing buffer and blot the plate onto paper
towels or other absorbent material. (See Step 5 for plate washing method).

8. Add 90 µl of prepared TMB color developing agent into each well and incubate plate at
37°C in dark for 25-30 min (Note: For reference only, the optimal incubation time
should be determined by end user. And the shades of blue can be seen in the wells with
the four most concentrated Human FIBRONECTIN standard solutions; the other wells
show no obvious color).

9. Add 0.1ml of prepared TMB stop solution into each well. The color changes into yellow
immediately.

10. Read the O.D. absorbance at 450nm in a microplate reader within 30 min after adding
the stop solution.

For calculation, (the relative O.D.\textsubscript{450}) = (the O.D.\textsubscript{450} of each well) – (the O.D.\textsubscript{450} of Zero
well). The standard curve can be plotted as the relative O.D.\textsubscript{450} of each standard solution
(Y) vs. the respective concentration of the standard solution (X). The Human
FIBRONECTIN concentration of the samples can be interpolated from the standard curve.

Note: if the samples measured were diluted, multiply the dilution factor to the
concentrations from interpolation to obtain the concentration before dilution.

**Summary**

1. Add samples and standards and incubate the plate at 37°C for 90 min. Do not wash.
2. Add biotinylated antibodies and incubate the plate at 37°C for 60 min. Wash plate
   3 times with 0.01M TBS.
3. Add ABC working solution and incubate the plate at 37°C for 30 min. Wash plate 5
times with 0.01M TBS.
4. Add TMB color developing agent and incubate the plate at 37°C in dark for 25-30
   min.
5. Add TMB stop solution and read.
10. Characteristics

1) Typical result

**Typical Data Obtained from Human FIBRONECTIN**

**Typical Human FIBRONECTIN ELISA kit Standard Curve**

This standard curve was generated at AbFrontier for demonstration purpose only. A standard curve must be run with each assay.

2) **Sensitivity:**  < 10pg/ml

3) **Specificity:** No detectable cross-reactivity with any other cytokine.
11. Troubleshooting

<table>
<thead>
<tr>
<th>Problem</th>
<th>Possible Cause</th>
<th>Solution</th>
</tr>
</thead>
</table>
| High signal and background in all wells | • Insufficient washing | • Increase number of washes  
• Too much AV-HRP | • Increase time of soaking between in wash  
• Incubation time too long | • Check dilution, titration  
• Development time too long | • Reduce incubation time  
• Decrease the incubation time before the stop solution is added |
| No signal | • Reagent added in incorrect order, or incorrectly prepared | • Review protocol  
• Standard has gone bad (If there is a signal in the sample wells) | • Check the condition of stored standard  
• Assay was conducted from an incorrect starting point | • Reagents allows to come to 20–30 °C before performing assay |
| Too much signal – whole plate turned uniformly blue | • Insufficient washing – unbound AV-HRP remaining | • Increase number of washes carefully  
• Too much AV-HRP | • Check dilution  
• Plate sealer or reservoir reused, resulting in presence of residual AV-HRP | • Use fresh plate sealer and reagent reservoir for each step |
| Standard curve achieved but poor discrimination between point | • Plate not developed long enough | • Increase substrate solution incubation time  
• Improper calculation of standard curve dilution | • Check dilution, make new standard curve |
| No signal when a signal is expected, but standard curve looks fine | • Sample matrix is masking detection | • More diluted sample recommended |
| Samples are reading too high, but standard curve is fine | • Samples contain protein levels above assay range | • Dilute samples and run again |
| Edge effect | • Uneven temperature around work surface | • Avoid incubating plate in areas where environmental conditions vary  
• Use plate sealer |
